Purpose

This plan shows what our group will do if the cafe ordering website stops working or loses data. Orders are the most important part, because a lost order means a customer may not get served. The plan covers the website on Vercel and the server and database that we will add in Week 7.

What can go wrong?

- The server or the hosting site is down.
- A new update has a bug that stops ordering.
- The database is damaged or the data is deleted.
- Our GIthub account or repository is lost or locked.

What will we do if the server goes down?

- **Notice the problem:** Anyone who sees it tells the group chat right away. We also open the health page of the server once a day.

- **Check the cause:** We look at the Vercel or Render dashboard and the logs to find out if the problem is the ghost, our code, or the database.
- **Keep the cafe running:** Staff write orders on paper with numbered slips while the system is down.
- **Fix it:** We restart the service. If a new update causes the problem, we roll back to the last good version, as explained in our Maintenance Plan.
- **Catch up:** When the system is back, we type the paper orders into the system.
- **Learn from it:** We write a short note about what happened and how to stop it next time.

Who is notified?

- The person who finds the problems tells the Team Lead in the group chat within 10 minutes.
- The Team Lead informs our cafe staff and gives a guess of when the system will be back.
- When it works again, we send a message to everyone.

Team Lead: [Name and Contact]

Problem Handler: [Name and Contact]

How long does it take to restore?

- Report the problem: Within 10 minutes
- Find the cause: Within 30 minutes
- Bring the site back or roll back: Within 2 hours
- Restore lost data from a backup: Within 4 hours
- Write the problem note: Within 2 days

Our code is saved on Github, and each member has a copy on their own computer. We save the database to a file once a day and keep it in a shared Google Drive folder. We do this because free hosting can erase data. Passwords and keys are not put in the code. We keep them in the hosting settings, and only the Team Lead and one other member know them.
